

TOPIC: RBA Setting

RBA - Risk Based Authentication

When it comes to the standard credential-based authentication process, the user will have to undergo two-factor authentication (2FA) or Multi-Factor Authentication (MFA), which is a One-Time Password (OTP) or password every time a transaction happens.

But with risk-based authentication, it is not necessary that the transaction must go through 2FA. Instead, every single transaction is monitored and assessed for risk. And a risk score is assigned to evaluate if the transaction can occur securely.

RBA - Flow
